

Peptides are short chains of 20 or fewer amino acids, shorter than in proteins. Natural cellular and tissue regeneration involve peptide chains and they can either induce or inhibit biological effects, acting as agonists or antagonists in physiological systems. When used therapeutically, peptides - recognized within the human physiology -

REGENAPEP

Joint Health & Anti-Inflammation

- SUPPRESS INFLAMMATION
- CARTILAGE REGENERATION
- PAIN RELIEF
- REDUCE DEPRESSION
- CHONDRO PROTECTION

REGENAPEP is a new TGA-certified joint health supplement that acts as an advanced reliever of musculoskeletal, rheumatic and arthritic pain, and a preventive system against potential onset of arthritis by alleviating conditions associated with early-stage musculoskeletal and joint inflammation.

This formula contains a unique active ingredient - colostrum (enriched with interleukin-1 receptor antagonist peptides), and a number of purified botanical extracts such as turmeric, white willow, devil's claw, boswellia serrate and ginger. All of the bioactive components in REGENAPEP's formula interact synergistically to promote anti-inflammatory effects and pain relief.

Indications:

Disease	Pathological Relation to Chronic Inflammation
Alzheimer's disease	Inflammatory cytokines induce autoimmune reactions
Arthritis	Inflammatory cytokines destroy articular cartilage and synovial fluid
Osteoarthritis	Cytokines block chondrocyte production and regeneration, causing cartilage erosion.
Fibromyalgia	Inflammatory cytokines destroy muscle tissue, causing chronic pain
Lupus	Inflammatory cytokines induced autoimmune attack
Fibrosis	Inflammatory cytokines attack the wounded tissues, causing normal tissues to be replaced by stiff fibrous connective tissues.
Rheumatism	
Soft tissue impairment	Chronic inflammation leads to overproduction of inflammatory factors Soft tissue trauma leads to an increase in inflammatory cytokine production
Sport Injury	Repetitive injury leads to excessive production of pro-inflammatory cytokines
psoriasis	Inflammatory cytokines lead to development of dermatitis
Chronic pain syndrome	Chronic pain syndrome triggers overproduction of inflammatory cytokines and thus leads to ineffectiveness of conventional analgesics and anti-inflammatory drugs.

Recommended Users

REGENAPEP is recommended for patients with early to mid-stage arthritis and non-arthritic adults seeking to maintain good musculoskeletal and joint health.
